

# Introducing Impressive

Martin J. Fiedler

version 0.10.4 / 0.10.5

<http://impressive.sourceforge.net/>

# What is Impressive?

## **Impressive is a PDF and image viewer optimized for presentations**

- ... with some eye candy ;)
- uses OpenGL for display
- uses Xpdf to render PDF files
- written in Python
- available for Unix-like and Windows operating systems
- Open Source (GPLv2)

# Software Requirements

Impressive requires a few libraries and helper applications:

- Python 2.5 or newer
- PyGame (SDL bindings for Python)
- PyOpenGL
- Python Imaging Library (PIL)
- Xpdf-utils or Poppler-utils
- pdftk

Packages for these dependencies should be available for almost every operating system.

For Windows, there's a convenient self-contained archive with everything needed.

# Hardware Requirements

- hardware accelerated OpenGL
  - every post-2000 graphics chip should do
  - on very fast systems, even a JIT-accelerated software renderer (e.g. Gallium LLVMpipe) might be sufficient
- a fast CPU
  - some transitions are quite CPU-intensive
  - rule of thumb: the faster the better!
  - absolute minimum is at about 700 MHz

# How does it work?

- 1 create slides with the presentation software of your choice
- 2 export them to a PDF file
- 3 impressive MySlides.pdf
  - left mouse button, mouse wheel down,  
 or  :  
next slide
  - right mouse button, mouse wheel up,  
 or  :  
previous slide
  -  or  : quit

# Emphasis

Impressive offers multiple ways of emphasizing parts of a page.

## Option 1: „Spotlight“

- toggle with 
- a bright circular spot follows the mouse cursor
- everything else gets dark and blurry
- spot size adjustable with  /  or the mouse wheel

# Highlight Boxes and Zoom

## Option 2: Highlight Boxes

- drag a box with the left mouse button
- any number of boxes per page
- delete a box by clicking it with the right mouse button
- boxes stay even after leaving and re-entering the page

## Option 3: Zoom

-  key toggles 2x zoom
- visible part can be moved around by dragging with the right mouse button

# Overview Page

- press the  key
- Impressive zooms back to an overview screen showing all pages of the presentation
- new page can be selected with mouse or keyboard
- left mouse button or  zooms into selected page
- right mouse button or  cancels and returns to the previously shown page

# Customization

- command line parameters (lots of them!)
- „Info Scripts“
  - same name as the input file, but suffix `.info`, e.g. `slides.pdf` → `slides.pdf.info`
  - real Python scripts, executed before the presentation starts
  - can be used to set the document title or other settings
  - can be used to set up per-page settings: „Page Properties“
    - title
    - transition effect
    - ...

# Info Script Example

```
# -*- coding: iso8859-1 -*-  
  
DocumentTitle = "Example Presentation"  
  
PageProps = {  
    1: { 'title': 'Title Page',  
        'transition': PagePeel },  
    2: { 'title': 'Introduction' },  
    5: { 'timeout': 3500 },  
    8: { 'overview': False }  
}
```

# Other Features

- clickable PDF hyperlinks inside the document
- page cache in RAM or on disk, temporary (default) or persistent
- background rendering
- fade to black or white
- time display and measurement
- automatic, timed presentations
- automatic reloading of the input file(s) on change
- playing sounds or videos or executing arbitrary Python code when entering a page

# Rarely Used Features

- rotation in 90-degree steps
- page bookmarks (keyboard shortcuts)
- only show a subset of the presentation
- hide specific pages from the overview page
- customization of almost every timing or OSD parameter
- permanent storage of the highlight boxes
- „Render Mode“: doesn't show the presentation, but renders the input PDF file into a directory with one PNG file per page

# Missing Features

- painting and annotations
- multi-monitor support
- support for embedded videos
- integration into (or cooperation with) latex-beamer and OpenOffice.org Impress
- *your feature here*
